

Practical: 6

AIM: Write a program to create parent class named Person and from the parent class derive two classes namely Student and Employee.

Classes shall have following attributes and methods: Person
→ name, age, gender, city, get(), set()

Student → id, semester, division,
sub1marks, sub2marks, sub3marks, result()

Employee → id, designation, salary, gross_salary()

Hint: for gross_salary(), consider, if salary < 10000, then HRA=10%, DA=5%, PF=200. If salary > 10000, then HRA=15%, DA=7%, PF=10%

Code:

class person:

```
def __init__(self, name, age, gender, city):
```

```
    self.name = name
```

```
    self.age = age
```

```
    self.gender = gender
```

```
    self.city = city
```

```
def get(self):
```

```
    print("Name:", self.name)
```

```
    print("Age:", self.age)
```

```
    print("Gender:", self.gender)
```

```
    print("City:", self.city)
```

```
def set(self):
```

```
    self.name = (input("Enter name:"))
```

```
    self.age = (input("Enter age:"))
```

```
self.gender = (input("Enter gender:"))
```

```
self.city = (input("Enter city:"))
```

```
class student(person):
```

```
    def __init__(self, name, age, gender, city, id, semester, division, sub1marks, sub2marks, sub3marks):
```

```
        super().__init__(name, age, gender, city)
```

```
        self.id = id
```

```
        self.semester = semester
```

```
        self.division = division
```

```
        self.sub1marks = sub1marks
```

```
        self.sub2marks = sub2marks
```

```
        self.sub3marks = sub3marks
```

```
    def result(self):
```

```
        total = self.sub1marks + self.sub2marks + self.sub3marks
```

```
        result = (total/300)*100
```

```
        print("result:", str(result))
```

```
class employee(person):
```

```
    def __init__(self, name, age, gender, city, eid, designation, salary):
```

```
        super().__init__(name, age, gender, city)
```

```
        self.eid = eid
```

```
        self.designation = designation
```

```
        self.salary = salary
```

```
    def gross_salary(self):
```

```
        if self.salary > 0 and self.salary < 10000:
```

```
            hra = self.salary*0.1
```

```
        da = self.salary*0.01
        pf = 200
        sal = self.salary+hra+da-pf
    else:
        hra = self.salary*0.15
        da = self.salary*0.07
        pf = 200
        sal = self.salary+hra+da-pf
    print("Salary:", str(sal))
```

```
name = input("Enter name:")
age = input("Enter age:")
gender = input("Enter gender:")
city = input("Enter city:")
id = input("Enter student id:")
semester = input("Enter semester:")
division = input("Enter division:")
sub1marks = int(input("Enter sub1marks:"))
sub2marks = int(input("Enter sub2marks:"))
sub3marks = int(input("Enter sub3marks:"))
s = student(name, age, gender, city, id, semester,
            division, sub1marks, sub2marks, sub3marks)
# s.get()
eid = input("Enter employee id:")
salary = int(input("Enter employee salary:"))
designation = input("Enter employee designation:")
# s.set()
s.result()
e = employee(name, age, gender, city, eid, designation, salary)
```

e.gross_salary()ss

Output:

Practical: 8

Aim: Write a Python program to prompt the user for hours and rate per hour using input to compute gross pay. Pay the hourly rate for the hours up to 40 and 1.5 times the hourly rate for all hours worked above 40 hours.

Hint: Use 45 hours and a rate of 10.50 per hour to test the program (the pay should be 498.75). You should use input to read a string and float() to convert the string to a number.

Code:

```
hrs = input("Enter hours:")
h = float(hrs)
basic_rate = 10.50
if h <= 40:
    pay = h*basic_rate
elif h > 40:
    pay = 40 * basic_rate + (h - 40) * 1.5 * basic_rate
else:
    print('Wrong data')
print(pay)
```

Practical: 11

Aim: Write a Python program to extract numbers from a text file containing and print sum of all extracted numbers.

Hint: Students need to create a text file containing numbers and characters in a working directory.

Code:

```
file = open('python.txt', 'w+')  
  
data = 'Geeks1 f2or G8e8e3k9s0'  
  
file.write(data)  
  
file.close()  
  
h = open('python.txt', 'r')  
  
content = h.readlines()  
  
a = 0  
  
for line in content:  
    for i in line:  
        if i.isdigit() == True:  
            a += int(i)  
  
print("The sum is:", a)
```

WRITING PROGRAMS OR PROGRAMMING IS A VERY CREATIVE
AND REWARDING ACTIVITY  YOU CAN WRITE PROGRAMS FOR
MANY REASONS RANGING FROM MAKING YOUR LIVING TO SOLVING
A DIFFICULT DATA ANALYSIS PROBLEM TO HAVING FUN TO HELPING
SOMEONE ELSE SOLVE A PROBLEM  THIS BOOK ASSUMES THAT
{\EM EVERYONE} NEEDS TO KNOW HOW TO PROGRAM AND THAT ONCE
YOU KNOW HOW TO PROGRAM, YOU WILL FIGURE OUT WHAT YOU WANT
TO DO WITH YOUR NEWFOUND SKILLS

WE ARE SURROUNDED IN OUR DAILY LIVES WITH COMPUTERS RANGING
FROM LAPTOPS TO CELL PHONES  WE CAN THINK OF THESE COMPUTERS
AS OUR PERSONAL ASSISTANTS WHO CAN TAKE CARE OF MANY THINGS
ON OUR BEHALF  THE HARDWARE IN OUR CURRENT-DAY COMPUTERS
IS ESSENTIALLY BUILT TO CONTINUOUSLY ASK US THE QUESTION
WHAT WOULD YOU LIKE ME TO DO NEXT

OUR COMPUTERS ARE FAST AND HAVE VASTS AMOUNTS OF MEMORY AND
COULD BE VERY HELPFUL TO US IF WE ONLY KNEW THE LANGUAGE TO
SPEAK TO EXPLAIN TO THE COMPUTER WHAT WE WOULD LIKE IT TO
DO NEXT IF WE KNEW THIS LANGUAGE WE COULD TELL THE
COMPUTER TO DO TASKS ON OUR BEHALF THAT WERE REPTITIVE
INTERESTINGLY, THE KINDS OF THINGS COMPUTERS CAN DO BEST
ARE OFTEN THE KINDS OF THINGS THAT WE HUMANS FIND BORING
AND MIND-NUMBING
PS C:\Users\SkyZone> |
```

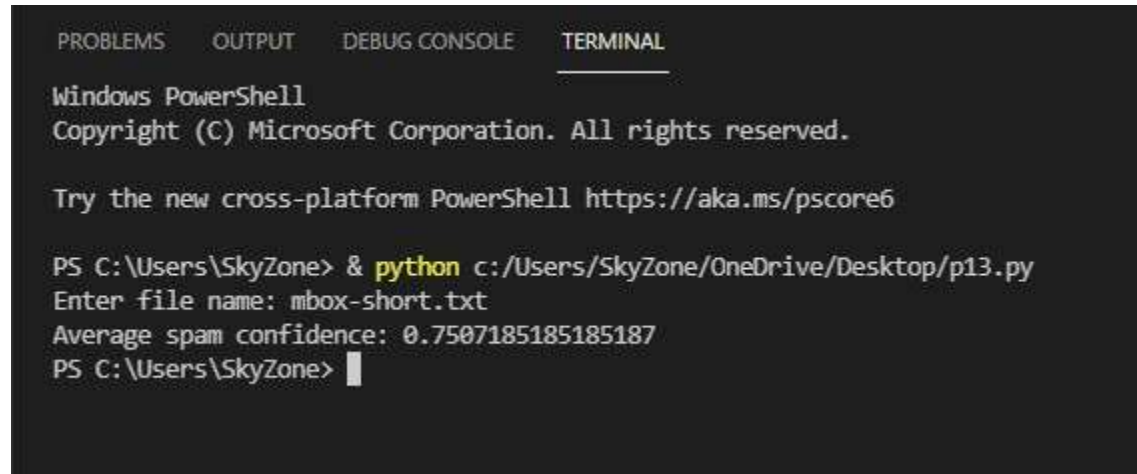

Practical: 13

Aim: Write a Python program that prompts for a file name, then opens that file and reads through the file, looking for lines of the form: **X-DSPAM-Confidence: 0.8475**. Count these lines and extract the floating point values from each of the lines and compute the average of those values and produce an output as shown below.

Note: Do not use the `sum()` function or a variable named `sum` in your solution. **Hint:** You can download below enter `mbox-short.txt` as the filename.

Code:

```
name = (input("Enter file name: "))
fh = open(name)
count = 0
total = 0
for line in fh:
    if not line.startswith("X-DSPAM-Confidence:"):
        continue
    t = line.find("0")
    number = float(line[t:])
    count = count + 1
    total = total + number
average = total/count
print("Average spam confidence:", average)
```

Output:
